## I. Introduction

The Passaic Valley Sewerage Commissioners (PVSC) provides wastewater treatment service to forty-seven (47) municipalities within their northeast New Jersey service area. The PVSC District covers approximately 150 square miles from Newark Bay to the upper regions of the Passaic River Basin adjacent to the Great Falls in Paterson. The main interceptor sewer of the PVSC, which begins at Prospect Street in Paterson, generally follows the alignment of the Passaic River to the PVSC Water Pollution Control Facility in the City of Newark. The extent of the PVSC Service District and the area combined sewer areas within the study area is illustrated in Figure 1.

Seven (7) of the municipalities within the PVSC District have combined sewer systems and have received Authorization to discharge under the General NJPDES Permit for Combined Sewer Systems. Two of the combined sewer municipalities, the Cities of Bayonne and Jersey City, own and operate their own combined sewer systems, interceptors, CSO Control Facilities, and pumping stations. In addition they jointly own the force main used to transport wastewater to the primary clarifiers at the PVSC treatment plant in Newark. The PVSC does not have any combined sewer overflow control or transportation facilities which service this section of the District. Consequently the Cities of Bayonne and Jersey City will be undertaking their own Characterization Studies.

The other municipalities with combined sewer systems include the Towns of Harrison and Kearny, the Borough of East Newark and the Cities of Newark and Paterson. All of these municipalities are tributary to PVSC interceptors and most of their combined sewer systems are tributary to CSO control facilities owned and/or operated by PVSC. Accordingly PVSC has offered to undertake the CSO Discharge Characterization Study on behalf of the Towns of Harrison and Kearny, the Borough of East Newark, and the Cities of Newark and Paterson. The City of Newark has decided to undertake its own monitoring program and is not included in the Work Plan nor in this Monitoring Report.

The NJDEP and the Passaic Valley Sewerage Commissioners agree that a cooperative or regional approach to the combined sewer overflow studies and modeling will be the only means of providing meaningful data and analyses. PVSC has, with NJDEP approval, undertaken coordination and

review of Solids and Floatables Control Projects for CSOs within its service district. As an extension to this, PVSC has offered to undertake and coordinate the CSO Discharge Characterization Study for all municipalities tributary to its transport facilities.

A coordination meeting was held with representatives of the combined sewer municipalities tributary to PVSC control and interceptor facilities on February 1, 1996. At that time PVSC indicated its willingness to undertake the CSO Characterization Study on behalf of each municipality. Most municipal representatives indicated a desire for PVSC to undertake this work on their behalf. The exception was the City of Newark, which will complete the monitoring and modeling requirements of their General Permit on their own.

## **II. Project Goals**

The project goals and objectives for the rainfall monitoring program conducted include:

- to develop a correlation between rainfall characteristics and the frequency of occurrence that causes a discharge
- to develop an understanding of the rainfall characteristic in the study area.
- to develop a network of real time rainfall monitoring for use in monitoring and modeling of CSO drainage basins.

Additional goals will be established under the Modeling Quality Assurance Work Plan which will define the short term and long term goals of the monitoring and modeling analysis.

The Passaic Valley Sewerage Commissioners has undertaken a Combined Sewer Overflow Discharge Characterization Study, pursuant to Part V.B., Condition 4a, 4d, 4e, and 4f of NJPDES Permit No. NJ0105023, to provide site specific data which will be used to develop and calibrate SWMM Model(s) of the combined sewer systems within the Towns of Harrison and Kearny, the Borough of East Newark, and the City of Paterson. The completion of this work is a requirement of the General Permit and the Individual Authorization provided to each CSO municipality.

## **III. Characterization of Rainfall**

A Quality Assurance/Work Plan for this project was submitted by Killam Associates to the NJDEP on February 28, 1996 in compliance with the March 1, 1996 deadline contained within the

General NJPDES Permit for Combined Sewer Systems. The Work Plan was submitted by PVSC on behalf of the Towns of Kearny and Harrison, the Borough of East Newark, and the City of Paterson. The City of Newark will proceed with the submission of its own Quality Assurance/Work Plan and Characterization Study. Work Plan approval was received from the NJDEP on December 3, 1997.

The two major tasks to be completed under the approved Work Plan are to compile real time and statistical data on rainfall in the study area and to monitoring flow and water quality of combined sewer drainage basins under dry and wet weather conditions. Monitoring of CSO drainage basins is reported on separately. This report provides information on the work completed in terms of rainfall characterization and monitoring.

#### **IV. Rainfall Event Characterization**

A statistical analysis of long-term records of rainfall in the project area was performed in order to address two different objectives. One objective was to develop a characterization of the storm events that occur in the study area which extends from the Town of Harrison in Hudson County to the City of Paterson in Passaic County. The analysis provide a basis for determining the return-period frequency of specific storm events that occur and which may be monitored during the course of the CSO study program. Another objective of this rainfall analysis is to determine similarities or differences between rainfall in the Paterson area at the northern end of the PVSC drainage area, and in the Newark area, at the southern end of the approximately 30-mile interceptor system. Previous studies by PVSC indicated spatial differences might exist between rainfall duration, intensity and total volume in the PVSC drainage area.

A rainfall-overflow correlation analysis will be performed to establish the characteristics and frequency of occurrence of rainfall events that cause CSO discharges from various portions of the PVSC interceptor system. This component of the overall rainfall analysis will be performed and presented as part of the modeling study report.

Characteristics of storm events in the PVSC drainage area used in the analysis are based on a 49-year record (1949 through 1997) for the US Weather Service (USWS) rain gage at Newark International Airport. This record provides a virtually complete, high quality data file for the statistical analyses performed. For the spatial comparisons between the Newark area and the Paterson area, the long-term record for the USWS rain gage at Little Falls was also analyzed. However, this record, covering the 23-year period 1969 through 1991, included significant gaps during periods when the rain gage was inoperative or produced defective results. Only a few of the years had a complete record with no missing data while most had missing data for one to three months. In a number of years, data for all or nearly all of the corresponding months were missing.

The Little Falls rain gage record was thus not considered suitable for defining long-term rainfall characteristics; and the Newark record was used exclusively for this purpose. The Little Falls data did however provide a suitable basis for evaluating spatial differences between rainfall in different portions of the PVSC drainage area. For this comparison duplicate edited records were prepared for both Newark and Little Falls, which included only the periods of valid, complete data at Little Falls. Since the data files so produced provide about 15 years of rainfall data, the comparison developed is considered to provide a valid indication of differences in rainfall characteristics in the two parts of the overall drainage area.

#### *A. General Rainfall Features*

The pattern of annual rainfall volume for the Newark rain gage, over the 49-year period of record is presented on Figure A. The Newark area averages 43.5 inches of rainfall, but individual years are seen to experience rainfall totals between 25 or 30 inches in dry years, to about 60 inches in wet ones. Overall, monthly rainfall volumes occur relatively uniformly over the course of the year, as indicated by the long-term average monthly rainfall totals illustrated by Figure B. Monthly rainfall averages range between 3 inches and just over 4 inches, without a definitive seasonal pattern.

The frequency distribution of largest storm volume (independent of the duration of the event) recorded during each of the 49 years is displayed on Figure C. These "big storms" may be as small as 1.5 or 2 inches, or as large as 7 or 8 inches as extreme values. Since these are annual values, the percentile shown is percent of years, so that the 10-year storm size (90 percent of the years being

Figure A

Associates Consulting Engineers

equal or smaller) can be scaled from the plot as 5 inches. That is, a storm that produces 5 inches or more of rainfall is expected every 10 years on average (e.g., there will be 5 such events in a 50-year period). Note that the larger volumes are normally associated with long duration events. The statistical analysis of storm events defines an event on the basis of a minimum of 4 consecutive dry hours between wet hours; accordingly there may be clusters of separate events that could produce larger volumes over periods of several days.

The storm event statistics presented in the following section are based on the characteristics of complete storm events (defined as just indicated by a 4-hour or greater inter-event time period). Such an event determination is most appropriate for storm water/CSO assessments addressing pollutant loading or BMP evaluations. However, another common method of characterizing rainfall is by means of IDF (intensity-duration-frequency curves). These curves provide the rainfall intensity associated with various durations, for a range of return periods. Since these statistics are associated with the peak portion of a storm event, rather than the full event, the appropriate application of IDF curves is for the design of hydraulic structures, to avoid an undesirable frequency of flooding. Although considered less appropriate for CSO assessment issues, in the interest of a complete analysis, a set of IDF curves based on the 49-year Newark rainfall record was developed, and is presented on Figure D.

#### ***B. Storm Event Characteristics***

Analyzing hourly rain data using the SYNOP statistical analysis program, originally developed for EPA and subsequently updated for FHWA, developed the characterization of study area storm events. SYNOP separates the hourly record into separate storm events, and determines the duration, volume, average intensity and proceeding dry interval, for each of the events. It then performs standard statistical analyses on the event record, including stratification of the record by year and by month.

Long-term statistics for the pertinent properties of the storm events contained in the 49-year Newark rain gage record, resulting from this analysis, are summarized by probability plots presented by Figures E-1 Volume, E-2 Average Intensity, E-3 Duration, and E-4 Dry Interval. The percentiles

represent the percentage of all storms having a value for the plotted storm parameter that is equal to or smaller than the magnitude of the value corresponding to the selected percentile.

Future monitored storms of interest can be scaled onto the appropriate plot to provide an indication of the frequency of the event of interest relative to the long-term record. Note that these plots represent percentage of events, and not return period. Results can be converted to return period on the basis of the long term average number of events per year, which the analysis indicates to be 119 for the Newark gage. Return period plots have been developed, and are presented later in this report.

#### *C. Newark - Paterson Comparison*

Differences in rainfall characteristics between opposite ends of the PVSC drainage area were assessed by comparing the rainfall records for the USWS gages at Newark and at Little Falls. The Newark record was edited so that it included only those periods for which valid data was available for Little Falls. A statistical rain event analysis using SYNOP was performed on both records. Summary statistics for these matched files is presented in Table 1, together with the similar statistics for the full 49-year record for Newark. As the tabulated results indicate for the period covered by the matched data, Newark rainfall is indicated to be somewhat higher than the long-term average.

Accordingly a comparison of the corresponding data for the Newark and Little Falls gages indicates that the northern end of the PVSC drainage area (near Paterson) experiences larger storm events with somewhat shorter durations and hence higher average intensities.

**Table 1 Comparative Long Term Rainfall Characteristics**

	Values for Average Event			
	Volume (in)	Average Intensity (in/hr)	Duration (hours)	Dry Interval (days)
NEWARK long term (49 years)	0.37	0.053	6.42	3.1
matched data for 12-15 year common period				
NEWARK	0.41	0.057	6.58	3.18
LITTLE FALLS	0.48	0.079	6.08	3.45
LITTLE FALLS long term (ratio computed)	0.43	0.074	5.93	3.36

Long-term statistics are normally required to develop return period curves for rainfall characteristics at Newark and Little Falls. The existing record Little Falls however is severely limited. The existing rainfall record for Little Falls was expanded by computing the ratio between the characteristic statistics between Newark and Little Falls for the matched period values and applying this ratio to Newark data to compute long-term statistics for Little Falls. This result is also presented in Table 1.

Long-term statistical properties (mean and variance) were applied to an assumed log-normal distribution, based on the distributions illustrated by the probability plots presented earlier on Figures E-1 through E-4. Return-period curves were then developed for Newark and Little Falls. Comparative return-period results for the two locations, for each of the storm event characteristics of interest, are presented on Figure F-1 Volume, F-2 Average Intensity, F-3 Duration, and F-4 Dry Interval. Apart from illustrating the nominal differences between the two gage locations, the plots may be referenced to determine the approximate frequency of a monitored event of interest in terms of return period.

## **V. Rainfall Monitoring in the Study Area**

As part of the rainfall monitoring study, a rain gage network has been established within the study area and maintained throughout the monitoring period. Each temporary gaging station established under the monitoring program is equipped with an ISCO Model 674-L tipping bucket logging rain gage with an 8-inch diameter tipping bucket and a Model 948 Data Transfer Unit. Rainfall intensities have been measured in 0.01 inch increments and logged at ten (10) minute

Associates Consulting Engineers

intervals. Units have been placed in locations which are open and free from outside influences such as trees or areas surrounded by tall buildings. Each gaging station location has been reviewed in the field and approved by representatives of the NJDEP.

In addition to the rain gages established under the study, the PVSC has a rain gage at the WPCF. The rainfall gage at PVSC is a Belfort Model 5-405 tipping bucket rain gage which also records precipitation in 0.01 inch increments. Signals from this rain gage are collected by computer and monitored continuously at 10 minute intervals. This gage was deactivated by construction at the PVSC plant and is currently not operational.

In addition to the temporary gages established there are two long term rain gages within the study area. The NOAA gages at Newark Airport and in Little Falls were used in the statistical evaluation of area rainfall and also during the monitoring periods. While the type of gage, monitoring intervals, and specific location for these sites are out of the direct control of this program, they do enhance our ability to estimate spatial rain distribution and are the only source of long term rainfall information for continuous simulations during historically critical periods. Accordingly, these gages will be used to supplement, as deemed necessary by experience, the temporary rain gages established under this program. All data utilized and/or adjusted will be documented and substantiated in the modeling report.

The rain gage network established for this project include three permanent and five temporary rain gage stations as follows:

City of Newark	NOAA Station at Newark Airport (permanent)	
PVSC	Permanent Rain Gage at WPCF (partial data)	
Little Falls	NOAA Station at PVWC (permanent)	
Town of Kearny	Temporary Rain Gage at Police Department Building Corner of Forest and Laurel	Gage #1

Town of Harrison	Temporary Rain Gage at Fire Department Headquarters 7 <sup>th</sup> Street and Wilhelm Street	Gage #2
City of Passaic	Temporary Rain Gage at PVSC Wallington Pumping Station	Gage #3
City of Paterson	Temporary Rain Gage at Madison Fire Station 850 Madison Avenue	Gage #4
City of Paterson	Temporary Rain Gage at Stanley Levine Reservoir Grand Street	Gage #5

The rain gage distribution for this project is illustrated on Figure 2. In addition, the precise location of each temporary rain gage is illustrated in Figures 2a through 2e. A rain gage station was not established in the City of Newark since they will undertake their own study.

The rain gage network for this project was initially established in January 1997 and ceased operation in January 2002 upon completion of field work. Summary data for each rain gage location is provided the Appendices by month. Each table provides summary data including the gage location, the month and year, total rainfall for the month inches, and total rainfall by hour and date recorded at each site. Data for the period of January 1997 through December 2001 has been provided.
